1                    2.     (Amended) A display device comprising:

2                    a display unit which displays an image;

3                    a display-data line which supplies data of the image from an exterior to said

4 display unit;

5                    memories which store information for controlling displaying of the data of the

6 image on said display unit, said information being different from said data of the image;

7                    an operation circuit unit which controls said display unit to display the data of

8 the image supplied through said display-data line based on the information stored in said

9 memories;

10                   a data bus which connects said memories to an exterior of said display device,

11 and supplies the information to said memories from the exterior of said display device; and

12                   an address bus which connects said memories to the exterior of said display

13 device, and supplies address signals for selecting one of said memories,

14                   wherein said operation circuit unit includes:

15                   a gate driver which drives gate lines of said display unit; and

16                   a data driver which drives data lines of said display unit, wherein at least one of

17 said gate driver and said data driver operates based on the information sotred in said

18 memories.
